

I am a licensed Amateur Radio Operator and am concerned about the potential nation-wide interference of BPL being transmitted over the frequencies below 30 Megahertz. The radio spectrum below 30 MHz is used by several agencies such as Red Cross, FEMA, Salvation Army and Amateur Radio during times of emergencies and BPL could interfere with these critical communications.

If you must implement BPL I ask that you choose portions of the radio spectrum in the UHF or higher frequency bands that would not interfere with communications like the radio spectrum below 30 MHz would cause.

Thank you,
Lee Groce
